Series Editor's Preface	vii
Introduction	xv
Chapter 1 Semi-Markov and Markov Chains	1
1.1 Definitions and basic properties	1
1.1.1 Discrete time semi-Markov and Markov behaviour of systems	3
1.1.2 Multi-step transition probability	6
1.1.3 Semi-Markov processes	8
1.1.4 State occupancy and waiting-time statistics	10
1.1.5 Non-homogeneous Markov processes	14
1.1.6 The limit theorem	16
1.1.7 Effect of small deviations in the transition probability matrix	18
1.1.7.1 Limits of some important characteristics for Markov chains	22
1.2 Algebraic and analytical methods in the study of Markovian systems	31
1.2.1 Eigenvalues and eigenvectors	31
1.2.2 Stochastic matrices	33
1.2.3 Perron-Frobenius theorem	34
1.2.4 The Geometric transformation (the z-transform)	35
1.2.5 Exponential transformation (Laplace transform)	37
1.3 Transient and recurrent processes	38
1.3.1 Transient processes	38
1.3.2 The study of recurrent state occupancy in Markov processes	41
1.4 Markovian populations	42
1.4.1 Vectorial processes with a Markovian structure	42
1.4.2 General branching processes	46
1.5 Partially observable Markov chains	48
1.5.1 The core process	50
1.5.2 The observation process	52
1.5.3 The state of knowledge and its dynamics	53
1.5.4 Examples	57
1.6 Rewards and discounting	67
1.6.1 Rewards for sequential decision processes	67
1.6.2 Rewards in decision processes with Markov structure	67
1.6.3 Markovian decision processes with and without discounting	68

1.7	Models and applications	70
1.7.1	Real systems with a Markovian structure	70
1.7.2	Model formulation and practical results	70
1.7.2.1	A semi-Markov model for hospital planning	70
1.7.2.2	System reliability	82
1.7.2.3	A Markovian interpretation for PERT networks	95
1.8	Dynamic-decision models for clinical diagnosis	102
1.8.1	Pattern recognition	102
1.8.2	Model optimization	103
Chapter 2	Dynamic and Linear Programming	105
2.1	Discrete dynamic programming	105
2.2	A linear programming formulation and an algorithm for computation	109
2.2.1	A general formulation for the LP problem and the Simplex method	109
2.2.2	Linear programming – a matrix formulation	113
Chapter 3	Utility Functions and Decisions under Risk	115
3.1	Informational lotteries and axioms for utility functions	115
3.2	Exponential utility functions	121
3.3	Decisions under risk and uncertainty; event trees	124
3.4	Probability encoding	126
Chapter 4	Markovian Decision Processes (Semi-Markov and Markov) with Complete Information (Completely Observable)	129
4.1	Value iteration algorithm (the finite horizon case)	129
4.1.1	Semi-Markov decision processes	129
4.1.2	Markov decision processes	131
4.2	Policy iteration algorithm (the finite horizon optimization)	133
4.2.1	Semi-Markov decision processes	133
4.2.2	Markov decision processes	140
4.3	Policy iteration with discounting	143
4.3.1	Semi-Markov decision processes	143
4.3.2	Markov decision processes	149
4.4	Optimization algorithm using linear programming	153
4.4.1	Semi-Markov decision process	153
4.4.2	Markov decision processes	158

45	Risk-sensitive decision processes	163
4.5.1	Risk-sensitive finite horizon Markov decision processes	163
4.5.2	Risk-sensitive infinite horizon Markov decision processes	168
4.5.3	Risk-sensitive finite horizon semi-Markov decision processes	175
4.5.4	Risk-sensitive infinite horizon semi-Markov decision processes	177
4.6	On eliminating sub-optimal decision alternatives in Markov and semi-Markov decision processes	181
4.6.1	Markov decision processes	181
4.6.2	Semi-Markov decision processes with finite horizon	183
Chapter 5	Partially Observable Markovian Decision Processes	187
5.1	Finite horizon partially observable Markov decision processes	187
5.2	The infinite horizon with discounting for partially observable Markov decision processes	202
5.2.1	Model formulation	202
5.2.2	The concept of finitely transient policies	207
5.2.3	The function $C(\pi \delta)$ approximated as a Markov process with a finite number of states	209
5.3	A useful policy iteration algorithm, for discounted ( $\beta < 1$ ) partially observable Markov decision processes	210
5.3.1	The case $\hat{v}$ for $N = 2$	210
5.3.2	The case $\hat{v}$ for $N > 2$	213
5.4	The infinite horizon without discounting for partially observable Markov processes	219
5.4.1	Model formulations	219
5.4.2	Cost of a stationary policy	219
5.4.3	Policy improvement phase	222
5.4.4	Policy iteration algorithm	223
5.5	Partially observable semi-Markov decision processes	228
5.5.1	Model formulation	229
5.5.2	State dynamics	230
5.5.3	The observation space	232
5.5.4	Overall system dynamics	233
5.5.5	Decision alternatives in clinical disorders	237

5.6	Risk-sensitive partially observable Markov decision processes	238
5.6.1	Model formulation and practical examples	238
5.6.1.1	Maintenance policies for a nuclear reactor pressure vessel	239
5.6.1.2	Medical diagnosis and treatment as applied to physiological systems	240
5.6.2	The stationary Markov decision process with probabilistic observations of states	240
5.6.3	A branch and bound algorithm	250
5.6.4	A Fibonacci search method for a branch and bound algorithm for a partially observable Markov decision process	254
5.6.5	A numerical example	255
Chapter 6	Policy Constraints in Markov Decision Processes	261
6.1	Methods of investigating policy constraints in Markov decision processes	261
6.2	Markov decision processes with policy constraints	263
6.2.1	A Lagrange multiplier formulation	266
6.2.2	Development and convergence of the algorithm	277
6.2.3	The case of transient states and periodic processes	284
6.3	Risk-sensitive Markov decision process with policy constraints	285
6.3.1	A Lagrange multiplier formulation	285
6.3.2	Development and convergence of the algorithm	292
Chapter 7	Applications	296
7.1	The emergency repair control for electrical power systems	296
7.1.1	Reliability and system effectiveness	296
7.1.2	Reward structure	297
7.1.3	The Markovian decision process for emergency repair	298
7.1.4	Linear programming formulation for repair optimization	301
7.1.5	The investment problem	303
7.2	Stochastic models for evaluation of inspection and repair schedules [2]	304
7.2.1	Inspection actions	308
7.2.1.1	Complete inspection	309
7.2.1.2	Control limit inspection	309
7.2.1.3	Inspection	310

7.2.2	Markov chain models	310
7.2.3	Cost structures and operating requirements	316
7.2.3.1	Inspection costs	316
7.2.3.2	Repair costs	316
7.2.3.3	Operating costs and requirements	317
7.2.3.4	Inspection and repair policies	318
7.2.3.5	Closed loop policies	318
7.2.3.6	Updating state probabilities after an inspection	321
7.2.3.7	Obtaining next-time state probabilities using transition matrix	321
7.2.3.8	Open loop policies	323
7.3	A Markovian decision model for clinical diagnosis and treatment applied to the respiratory system	324
7.3.1	Concept of state in the respiratory system	326
7.3.2	The clinical observation space	329
7.3.3	Computing probabilities in cause-effect models and overall system dynamics	330
7.3.4	Decision alternatives in respiratory disorders	334
7.3.4.1	Branch and bound algorithm	336
7.3.4.2	Steps in the branch and bound algorithm	338
7.3.5	A numerical example for the respiratory system	339
7.3.6	Conclusions	343
	Bibliography	344
	Index	352
