Preface	vii
Acknowledgements	ix
Conventions and definitions	x
1 Food webs	1
1.1 What and why?	1
1.2 Where?	1
1.3 How?	5
2 Models and their local stability	12
2.1 Introduction	12
2.2 Models	12
2.3 Stability	19
2.4 Summary	34
Appendix 2A: Taylor's expansion	36
Appendix 2B: An example of calculating eigenvalues	39
Appendix 2C: Jacobian matrices	40
3 Stability: other definitions	42
3.1 Introduction	42
3.2 Global stability	42
3.3 Species deletion stability	47
3.4 Stability in stochastic environments	49
3.5 Other stability criteria	54
3.6 Summary: models and their stabilities – Is there a best buy?	56
4 Food web complexity I: theoretical results	60
4.1 Introduction	60
4.2 Bounds on food web complexity: local stability	62
4.3 Complexity and stability under large perturbations	73
4.4 Summary of theoretical results	82
5 Food web complexity II: empirical results	84
5.1 Direct tests	84
5.2 Indirect tests	91
5.3 Summary	96

vi Contents

6	The length of food chains	99
6.1	Introduction	99
6.2	Hypothesis A: Energy flow	104
6.3	Hypothesis B: Size and other design constraints	110
6.4	Hypothesis C: Optimal foraging; why are food chains so long?	114
6.5	Hypothesis D: Dynamical constraints	115
6.6	Summary	122
	Appendix 6A: Drawing inferences about food web attributes	124
7	The patterns of omnivory	131
7.1	Models of omnivory	132
7.2	Testing the hypotheses	137
7.3	Summary	141
8	Compartments	143
8.1	Reasons for a compartmented design	144
8.2	Testing the hypotheses: habitats as compartments	148
8.3	Testing the hypotheses: compartments within habitats	159
8.4	Four comments	162
8.5	Summary	164
9	Descriptive statistics	165
9.1	Predator–prey ratios	166
9.2	The number of species of prey that a species exploits and the number of species of predator it suffers	169
9.3	Interval and non-interval food webs	176
9.4	Summary	183
10	Food web design: causes and consequences	186
10.1	Introduction	186
10.2	Causes	186
10.3	Consequences	191
10.4	Summary	201
	Bibliography	204
	Index	214
