

Contents

1. <i>What is a model?</i>	1
1.1 The idea of a mathematical model and its relation to other uses of the word	1
1.2 Relations between models with respect to origins	7
1.3 Relations between models with respect to purpose and conditions	18
1.4 How should a model be judged?	22
2. <i>The different types of model</i>	27
2.1 Verbal models and mechanical analogies	27
2.2 Finite models	29
2.3 Fuzzy subsets	32
2.4 Statistical models	34
2.5 Difference and differential equations	34
2.6 Stochastic models	36
3. <i>How to formulate a model</i>	39
3.1 Laws and conservation principles	39
3.2 Constitutive relations	44
3.3 Discrete and continuous models	47
4. <i>How should a model be manipulated into its most responsive form?</i>	54
4.1 Introductory suggestions	54
4.2 Natural languages and notations	58
4.3 Rendering the variables and parameters dimensionless	60
4.4 Reducing the number of equations and simplifying them	69
4.5 Getting partial insights into the form of the solution	77
4.5.1 The phase plane and competing populations	78
4.5.2 Coarse numerical methods and their uses	83
4.5.3 The interaction of easier and more difficult problems	86

5. <i>How should a model be evaluated?</i>	104
5.1 Effective presentation of a model	104
5.2 Extensions of models	114
5.3 Observable quantities	123
5.4 Comparison of models and prototypes and of models among themselves	126

Appendices

A. Longitudinal diffusion in a packed bed	129
B. The coated tube chromatograph and Taylor diffusion	138
C. The stirred tank reactor	152

Appendices to the Dover Edition

I. Re, k and π : A Conversation on Some Aspects of Mathematical Modelling	193
II. The Jail of Shape	203
III. The Mere Notion of a Model	219
IV. Ut Simulacrum, Poesis	231
V. Manners Makyth Modellers	249
VI. How to Get the Most Out of an Equation without Really Trying	259
