

CONTENTS

Preface

ix

1 INTRODUCTION TO CONTROL THEORY

1.1 Transition from the calculus of variations to optimal control	1
1.2 Transition from theory to practice	3
References	

2 CONTINUOUS TIME MODELS

2.0 Overview of control problems	9
2.1 Observability and controllability	10
2.2 Stability analysis	15
2.3 The maximum principle	32
2.4 Constraints	39
2.5 Example 1; A limit pricing model.	41
2.6 Example 2; reaching a steady state cycle	54
References	

3 DISCRETE TIME MODELS

3.0 Introduction	63
3.1 General deterministic and discrete control problems	63
3.2 The linear quadratic problem	68
3.3 Analytic solution of the Riccati equation	80
3.4 Equivalent dynamic equations	83
3.5 Discrete control of nonlinear systems	87
3.6 Observability and observers	89
3.7 Economic examples	89
References	

4 STOCHASTIC CONTROL THEORY

4.0 Introduction	97
4.1 Stochastic processes under control	97
4.2. Economic applications	102
4.3 Kalman filtering methods	117
4.4 Concluding remarks	143
References	

5 ECONOMIC IMPLICATIONS OF STOCHASTIC CONTROL

5.0	Introduction	
5.1	Time inconsistency problems	147
5.2	Short-run vs. long-run optimality	147
5.3	Model of adjustment costs with rational expectations	152
5.4	An application to new growth theory: dynamic adjustments with learning by doing	158
5.5	Concluding remarks.	160
	References	175

6 VARIABLE STRUCTURE SYSTEMS

6.0	Introduction	
6.1	The variable structure control formulation	181
6.2	A VSC approximation of an optimal control law	181
6.3	Example; The expectations-augmented Phillips relation	191
6.4	Concluding remarks	193
	References	207

7 RISK SENSITIVITY, ADJUSTMENT OF CONTROL AND ESTIMATION

7.0	Introduction	
7.1	Learning process in differential games	211
7.2	Adjustment costs in portfolio models	211
7.3	Econometric estimation of controlled systems	213
7.4	Estimating transversality conditions	232
7.5	Concluding remarks	239
	References	247

Appendix	249
