<b>Preface</b>	xiii
<b>Some frequently used notations</b>	xv
<b>1 Measure theory and probability</b>	<b>1</b>
1.1 Sets which do not belong in a strong sense, to a $\sigma$ -field	1
1.2 Some criteria for uniform integrability	3
1.3 When does weak convergence imply the convergence of expectations?.	4
1.4 Conditional expectation and the Monotone Class Theorem	5
1.5 $L^p$ -convergence of conditional expectations	5
1.6 Measure preserving transformations	6
1.7 Ergodic transformations	6
1.8 Invariant $\sigma$ -fields	7
1.9 Extremal solutions of (general) moments problems	8
1.10 The log normal distribution is moments indeterminate	9
1.11 Conditional expectations and equality in law	10
1.12 Simplifiable random variables	11
1.13 Mellin transform and simplification	12
Solutions for Chapter 1	13
<b>2 Independence and conditioning</b>	<b>25</b>
2.1 Independence does not imply measurability with respect to an independent complement	26

2.2	Complement to Exercise <b>2.1</b> : further statements of independence versus measurability . . . . .	27
2.3	Independence and mutual absolute continuity . . . . .	27
2.4	Size-biased sampling and conditional laws . . . . .	28
2.5	Think twice before exchanging the order of taking the supremum and intersection of $\sigma$ -fields! . . . . .	29
2.6	Exchangeability and conditional independence: de Finetti's theorem .	30
2.7	Too much independence implies constancy . . . . .	31
2.8	A double paradoxical inequality . . . . .	32
2.9	Euler's formula for primes and probability . . . . .	33
2.10	The probability, for integers, of being relatively prime . . . . .	34
2.11	Bernoulli random walks considered at some stopping time . . . . .	35
2.12	cosh, sinh, the Fourier transform and conditional independence . . .	36
2.13	cosh, sinh, and the Laplace transform . . . . .	37
2.14	Conditioning and changes of probabilities . . . . .	38
2.15	Radon–Nikodym density and the Acceptance–Rejection Method of von Neumann . . . . .	39
2.16	Negligible sets and conditioning . . . . .	39
2.17	Gamma laws and conditioning . . . . .	41
2.18	Random variables with independent fractional and integer parts . . .	42
	Solutions for Chapter 2 . . . . .	43

### **3 Gaussian variables 67**

3.1	Constructing Gaussian variables from, but not belonging to, a Gaussian space . . . . .	68
3.2	A complement to Exercise 3.1 . . . . .	68
3.3	On the negative moments of norms of Gaussian vectors . . . . .	69
3.4	Quadratic functionals of Gaussian vectors and continued fractions . .	70
3.5	Orthogonal but non-independent Gaussian variables . . . . .	72

3.6	Isotropy property of multidimensional Gaussian laws . . . . .	73
3.7	The Gaussian distribution and matrix transposition . . . . .	73
3.8	A law whose $n$ -samples are preserved by every orthogonal transformation is Gaussian . . . . .	74
3.9	Non-canonical representation of Gaussian random walks . . . . .	74
3.10	Concentration inequality for Gaussian vectors . . . . .	76
3.11	Determining a jointly Gaussian distribution from its conditional marginals . . . . .	77
	Solutions for Chapter 3 . . . . .	78
<b>4</b>	<b>Distributional computations</b>	<b>91</b>
4.1	Hermite polynomials and Gaussian variables . . . . .	92
4.2	The beta-gamma algebra and Poincaré's Lemma . . . . .	93
4.3	An identity in law between reciprocals of gamma variables . . . . .	96
4.4	The Gamma process and its associated Dirichlet processes. . . . .	97
4.5	Gamma variables and Gauss multiplication formulae . . . . .	98
4.6	The beta-gamma algebra and convergence in law . . . . .	100
4.7	Beta-gamma variables and changes of probability measures . . . . .	100
4.8	Exponential variables and powers of Gaussian variables . . . . .	101
4.9	Mixtures of exponential distributions . . . . .	102
4.10	Some computations related to the lack of memory property of the exponential law . . . . .	103
4.11	Some identities in law between Gaussian and exponential variables .	104
4.12	Some functions which preserve the Cauchy law . . . . .	105
4.13	Uniform laws on the circle . . . . .	105
4.14	Trigonometric formulae and probability . . . . .	106
4.15	A multidimensional version of the Cauchy distribution . . . . .	106
4.16	Some properties of the Gauss transform . . . . .	108
4.17	Unilateral stable distributions (1) . . . . .	110

**Where is the notion  $N$  discussed ? . . . . . 226**

**Final suggestions: how to go further ? . . . . . 227**

**References . . . . . 229**

**Index . . . . . 235**
