

Contents

1	Basic examples	1
1.1	How things vary with p	1
1.1.1	Quadratic Reciprocity Law	1
1.1.2	Sign functions	5
1.1.3	Checking modularity of sign functions	6
1.1.4	Examples	7
1.2	Recognizing numbers	10
1.2.1	Rational numbers in \mathbf{R}	10
1.2.2	Rational numbers modulo m	14
1.2.3	Algebraic numbers	15
1.3	Bernoulli polynomials	19
1.3.1	Definition and properties	19
1.3.2	Calculation	20
1.3.3	Related questions	21
1.3.4	Proofs	23
1.4	Sums of squares	27
1.4.1	$k = 1$	28
1.4.2	$k = 2$	28
1.4.3	$k \geq 3$	29
1.4.4	The numbers $r_k(n)$	31
1.4.5	Theta functions	36
1.5	Exercises	36
2	Reciprocity	40
2.1	More variation with p	40
2.1.1	Local zeta functions	40
2.1.2	Formulation of reciprocity	41
2.1.3	Global zeta functions	43

2.2	The cubic case	44
2.2.1	Two examples	45
2.2.2	A modular case	46
2.2.3	A non-modular case	48
2.3	The Artin map	50
2.3.1	A Galois example	50
2.3.2	A non-Galois example	53
2.4	Quantitative version	55
2.4.1	Application of a theorem of Tchebotarev	55
2.4.2	Computing densities numerically	56
2.5	Galois groups	59
2.5.1	Tchebotarev's theorem	63
2.5.2	Trink's example	64
2.5.3	An example related to Trink's	65
2.6	Exercises	69
3	Positive definite binary quadratic forms	71
3.1	Basic facts	71
3.1.1	Reduction	72
3.1.2	Cornachia's algorithm	73
3.1.3	Class number	75
3.1.4	Composition	76
3.2	Examples of reciprocity for imaginary quadratic fields	77
3.2.1	Dihedral group of order 6	77
3.2.2	Theta functions again	79
3.2.3	Dihedral group of order 10	82
3.2.4	An example of F. Voloch	84
3.2.5	Final comments	90
3.3	Exercises	91
4	Sequences	92
4.1	Trinomial numbers	92
4.1.1	Formula	92
4.1.2	Differential equation and linear recurrence	93
4.1.3	Algebraic equation	98
4.1.4	Hensel's lemma and Newton's method	99
4.1.5	Continued fractions	103
4.1.6	Asymptotics	107

4.1.7	More coefficients in the asymptotic expansion	109
4.1.8	Can we sum the asymptotic series?	111
4.2	Recognizing sequences	113
4.2.1	Values of a polynomial	113
4.2.2	Values of a rational function	114
4.2.3	Constant term recursion	115
4.2.4	A simple example	117
4.3	Exercises	119
<hr/>		
5	Combinatorics	123
<hr/>		
5.1	Description of the basic algorithm	123
5.2	Partitions	127
5.2.1	The number of partitions	128
5.2.2	Dual partition	130
5.3	Irreducible representations of S_n	131
5.3.1	Hook formula	132
5.3.2	The Murnaghan–Nakayama rule	133
5.3.3	Counting solutions to equations in S_n	138
5.3.4	Counting homomorphism and subgroups	139
5.4	Cyclotomic polynomials	143
5.4.1	Values of ϕ below a given bound	143
5.4.2	Computing cyclotomic polynomials	145
5.5	Exercises	148
<hr/>		
6	p -adic numbers	151
<hr/>		
6.1	Basic functions	151
6.1.1	Mahler's expansion	151
6.1.2	Hensel's lemma and Newton's method (again)	152
6.2	The p -adic gamma function	155
6.2.1	The multiplication formula	158
6.3	The logarithmic derivative of Γ_p	159
6.3.1	Application to harmonic sums	161
6.3.2	A formula of J. Diamond	163
6.3.3	Power series expansion of $\psi_p(x)$	164
6.3.4	Application to congruences	167

6.4	Analytic continuation	168
6.4.1	An example of Dwork	169
6.4.2	A generalization	170
6.4.3	Dwork's exponential	170
6.5	Gauss sums and the Gross–Koblitz formula	172
6.5.1	The case of \mathbf{F}_p	172
6.5.2	An example	174
6.6	Exercises	175
7	Polynomials	177
7.1	Mahler's measure	177
7.1.1	Simple search	178
7.1.2	Refining the search	179
7.1.3	Counting roots on the unit circle	182
7.2	Applications of the Graeffe map	182
7.2.1	Detecting cyclotomic polynomials	182
7.2.2	Detecting cyclotomic factors	184
7.2.3	Wedge product polynomial	184
7.2.4	Interlacing roots of unity	185
7.3	Exercises	188
8	Remarks on selected exercises	189
