PART I VIROLOGY AND VIRAL DISEASE 1

Chapter 1 Introduction – The Impact of Viruses on Our View of Life 3

Chapter 2 An Outline of Virus Replication and Viral Pathogenesis 15

Chapter 3 Virus Disease in Populations and Individual Animals 27

Chapter 4 Patterns of Some Viral Diseases of Humans 41

PART II BASIC PROPERTIES OF VIRUSES AND VIRUS-CELL INTERACTION 63

Chapter 5 Virus Structure and Classification 65

Chapter 6 The Beginning and End of the Virus Replication Cycle 79

Chapter 7 Host Immune Response to Viral Infection – The Nature of the Vertebrate Immune Response 97

Chapter 8 Strategies to Protect Against and Combat Viral Infection 119

PART III WORKING WITH VIRUS 145

Chapter 9 Visualization and Enumeration of Virus Particles 147

Chapter 10 Replicating and Measuring Biological Activity of Viruses 155

Chapter 11 Physical and Chemical Manipulation of the Structural Components of Viruses 173

Chapter 12 Characterization of Viral Products Expressed in the Infected Cell 193

Chapter 13 Viruses Use Cellular Processes to Express their Genetic Information 213

PART IV REPLICATION PATTERNS OF SPECIFIC VIRUSES 243

Chapter 14 Replication of Positive-sense RNA Viruses 245

Chapter 15 Replication Strategies of RNA Viruses Requiring RNA-directed mRNA Transcription as the First Step in Viral Gene Expression 273

Chapter 16 Replication Strategies of Small and Medium-sized DNA Viruses 303

BRIEF CONTENTS

- Chapter 17 Replication of Some Nuclear-replicating Eukaryotic DNA Viruses with Large Genomes 331
- Chapter 18 Replication of Cytoplasmic DNA Viruses and “Large” Bacteriophages 359
- Chapter 19 Retroviruses: Converting RNA to DNA 381
- Chapter 20 Human Immunodeficiency Virus Type 1 (HIV-1) and Related Lentiviruses 399
- Chapter 21 Hepadnaviruses: Variations on the Retrovirus Theme 413

PART V VIRUSES: NEW APPROACHES AND NEW PROBLEMS 433

- Chapter 22 The Molecular Genetics of Viruses 435
 - Chapter 23 Molecular Pathogenesis 463
 - Chapter 24 Viral Bioinformatics and Beyond 473
 - Chapter 25 Viruses and the Future – Problems and Promises 485
-
- Appendix Resource Center 501
 - Technical Glossary 507
 - Index 533

PART I VIROLOGY AND VIRAL DISEASE 1

CHAPTER 1 Introduction – The Impact of Viruses on Our View of Life 3

The science of virology 3

The effect of virus infections on the host organism and populations
– viral pathogenesis, virulence, and epidemiology 4

The interaction between viruses and their hosts 6

The history of virology 7

Examples of the impact of viral disease on human history 8

Examples of the evolutionary impact of the virus–host
interaction 9

The origin of viruses 9

Viruses have a constructive as well as destructive impact on
society 12

Viruses are not the smallest self-replicating pathogens 13

Questions for Chapter 1 14

CHAPTER 2 An Outline of Virus Replication and Viral Pathogenesis 15

Virus replication 15

Stages of virus replication in the cell 17

Pathogenesis of viral infection 19

Stages of virus-induced pathology 19

Initial stages of infection – entry of the virus into the host	20
The incubation period and spread of virus through the host	21
Multiplication of virus to high levels – occurrence of disease symptoms	23
The later stages of infection – the immune response	24
The later stages of infection – virus spread to the next individual	24
The later stages of infection – fate of the host	24
Questions for Chapter 2	25

CHAPTER 3 Virus Disease in Populations and Individual Animals 27

The nature of virus reservoirs	27
Some viruses with human reservoirs	28
Some viruses with vertebrate reservoirs	30
Viruses in populations	30
Viral epidemiology in small and large populations	30
Factors affecting the control of viral disease in populations	33
Animal models to study viral pathogenesis	34
A mouse model for studying poxvirus infection and spread	35
Rabies: where is the virus during its long incubation period?	37
Herpes simplex virus latency	37
Murine models	39
Rabbit models	40
Guinea pig models	40
Questions for Chapter 3	40

CHAPTER 4 Patterns of Some Viral Diseases of Humans 41

The dynamics of human–virus interactions	42
The stable association of viruses with their natural host places specific constraints on the nature of viral disease and mode of persistence	42
Classification of human disease-causing viruses according to virus–host dynamics	44
Viral diseases leading to persistence of the virus in the host are generally associated with viruses having long associations with human populations	44
Viral diseases associated with acute, severe infection are suggestive of zoonoses	48
Patterns of specific viral diseases of humans	49
Acute infections followed by virus clearing	49
Colds and respiratory infections	49
Influenza	49
Variola	49
Infection of an “accidental” target tissue leading to permanent damage despite efficient clearing	50
Persistent viral infections	50
Papilloma and polyomavirus infections	50
Herpesvirus infections and latency	52
Other complications arising from persistent infections	52
Viral and subviral diseases with long incubation periods	53
Rabies	53

HIV–AIDS	53
Prion diseases	54
Some viral infections targeting specific organ systems	54
Viral infections of nerve tissue	54
Examples of viral encephalitis with grave prognosis	55
Rabies	55
Herpes encephalitis	55
Viral encephalitis with favorable prognosis for recovery	56
Viral infections of the liver (viral hepatitis)	56
Hepatitis A	57
Hepatitis B	57
Hepatitis C	57
Hepatitis D	57
Hepatitis E	58
Questions for Chapter 4	58
Problems for Part I	59
Additional Reading for Part I	61

PART II BASIC PROPERTIES OF VIRUSES AND VIRUS–CELL INTERACTION 63

CHAPTER 5 Virus Structure and Classification 65

The features of a virus	65
Viral genomes	69
Viral capsids	69
Viral envelopes	72
Classification schemes	72
The Baltimore scheme of virus classification	75
Disease-based classification schemes for viruses	75
The virosphere	77
Questions for Chapter 5	78

CHAPTER 6 The Beginning and End of the Virus Replication Cycle 79

Outline of the virus replication cycle	79
Viral entry	80
Animal virus entry into cells – the role of the cellular receptor	80
Mechanisms of entry of nonenveloped viruses	83
Entry of enveloped viruses	84
Entry of virus into plant cells	85
Injection of bacteriophage DNA into <i>Escherichia coli</i>	87
Nonspecific methods of introducing viral genomes into cells	89
Late events in viral infection: capsid assembly and virion release	89
Assembly of helical capsids	89
Assembly of icosahedral capsids	92
Generation of the virion envelope and egress of the enveloped virion	93
Questions for Chapter 6	96

CHAPTER 7 Host Immune Response to Viral Infection – The Nature of the Vertebrate Immune Response 97

The innate immune response – early defense against pathogens	98
Toll-like receptors	99

Defensins	99
The adaptive immune response and the lymphatic system	100
Two pathways of helper T response – the fork in the road	101
The immunological structure of a protein	102
Role of the antigen-presenting cell in initiation of the immune response	104
Clonal selection of immune reactive lymphocytes	107
Immune memory	108
Complement-mediated cell lysis	108
Control and dysfunction of immunity	108
Specific viral responses to host immunity	109
Passive evasion of immunity – antigenic drift	110
Passive evasion of immunity – internal sanctuaries for infectious virus	110
Passive evasion of immunity – immune tolerance	110
Active evasion of immunity – immunosuppression	111
Active evasion of immunity – blockage of MHC antigen presentation	111
Consequences of immune suppression to virus infections	112
Measurement of the immune reaction	112
Measurement of cell-mediated (T-cell) immunity	112
Measurement of antiviral antibody	112
Enzyme-linked immunosorbent assays (ELISAs)	113
Neutralization tests	114
Inhibition of hemagglutination	114
Complement fixation	115
Questions for Chapter 7	117

CHAPTER 8	Strategies to Protect Against and Combat Viral Infection	119
	Vaccination – induction of immunity to prevent virus infection	120
	Antiviral vaccines	120
	Smallpox and the history of vaccination	120
	How a vaccine is produced	122
	Live-virus vaccines	122
	Killed-virus vaccines	123
	Recombinant virus vaccines	124
	Capsid and subunit vaccines	124
	DNA vaccines	125
	Edible vaccines	125
	Problems with vaccine production and use	125
	Eukaryotic cell-based defenses against virus replication	126
	Interferon	126
	Induction of interferon	127
	The antiviral state	128
	Measurement of interferon activity	128
	Other cellular defenses against viral infection	130
	Small RNA-based defenses	130
	Enzymatic modification of viral genomes	131
	Antiviral drugs	131

Targeting antiviral drugs to specific features of the virus replication cycle	131
Acyclovir and the herpesviruses	132
Blocking influenza virus entry and virus maturation	132
Chemotherapeutic approaches for HIV	134
Multiple drug therapies to reduce or eliminate mutation to drug resistance	134
Other approaches	135
Bacterial antiviral systems – restriction endonucleases	135
Questions for Chapter 8	136
Problems for Part II	139
Additional Reading for Part II	143

PART III WORKING WITH VIRUS 145

CHAPTER 9 Visualization and Enumeration of Virus Particles	147
Using the electron microscope to study and count viruses	147
Counting (enumeration) of virions with the electron microscope	149
Atomic force microscopy – a rapid and sensitive method for visualization of viruses and infected cells, potentially in real time	151
Indirect methods for “counting” virus particles	152
Questions for Chapter 9	154

CHAPTER 10 Replicating and Measuring Biological Activity of Viruses	155
Cell culture techniques	156
Maintenance of bacterial cells	156
Plant cell cultures	156
Culture of animal and human cells	157
Maintenance of cells in culture	157
Types of cells	157
Loss of contact inhibition of growth and immortalization of primary cells	159
The outcome of virus infection in cells	160
Fate of the virus	160
Fate of the cell following virus infection	162
Cell-mediated maintenance of the intra- and intercellular environment	162
Virus-mediated cytopathology – changes in the physical appearance of cells	163
Virus-mediated cytopathology – changes in the biochemical properties of cells	163
Measurement of the biological activity of viruses	164
Quantitative measure of infectious centers	164
Plaque assays	164
Generation of transformed cell foci	165
Use of virus titers to quantitatively control infection conditions	166
Examples of plaque assays	167
Statistical analysis of infection	168

Dilution endpoint methods	169
The relation between dilution endpoint and infectious units of virus	169
Questions for Chapter 10	170

CHAPTER 11 Physical and Chemical Manipulation of the Structural Components of Viruses 173

Viral structural proteins	173
Isolation of structural proteins of the virus	174
Size fractionation of viral structural proteins	176
Determining the stoichiometry of capsid proteins	177
The poliovirus capsid – a virion with equimolar capsid proteins	178
Analysis of viral capsids that do not contain equimolar numbers of proteins	179
Characterizing viral genomes	179
Sequence analysis of viral genomes	180
Measuring the size of viral genomes	184
Direct measure of DNA genome lengths in the electron microscope	185
Rate zonal sedimentation and gel electrophoresis for measuring viral genome size	185
The polymerase chain reaction – detection and characterization of extremely small quantities of viral genomes or transcripts	187
Real time PCR for precise quantitative measures of viral DNA	189
PCR detection of RNA	190
PCR as an epidemiological tool	190
Questions for Chapter 11	191

CHAPTER 12 Characterization of Viral Products Expressed in the Infected Cell 193

Characterization of viral proteins in the infected cell	193
Pulse labeling of viral proteins at different times following infection	194
Use of immune reagents for study of viral proteins	195
Working with antibodies	196
Detection of viral proteins using immunofluorescence	198
Related methods for detecting antibodies bound to antigens	201
Detecting and characterizing viral nucleic acids in infected cells	205
Detecting the synthesis of viral genomes	205
Characterization of viral mRNA expressed during infection	205
In situ hybridization	207
Further characterization of specific viral mRNA molecules	209
Use of microarray technology for getting a complete picture of the events occurring in the infected cell	210
Questions for Chapter 12	212

CHAPTER 13	Viruses Use Cellular Processes to Express Their Genetic Information	213
	Prokaryotic DNA replication is an accurate enzymatic model for the process generally	215
	The replication of eukaryotic DNA	216
	The replication of viral DNA	217
	The effect of virus infection on host DNA replication	217
	Expression of mRNA	217
	Prokaryotic transcription	219
	Prokaryotic RNA polymerase	219
	The prokaryotic promoter and initiation of transcription	220
	Control of prokaryotic initiation of transcription	220
	Termination of prokaryotic transcription	221
	Eukaryotic transcription	221
	The promoter and initiation of transcription	221
	Control of initiation of eukaryotic transcription	223
	Processing of precursor mRNA	224
	Visualization and location of splices in eukaryotic transcripts	226
	Posttranscriptional regulation of eukaryotic mRNA function	231
	Virus-induced changes in transcription and posttranscriptional processing	232
	The mechanism of protein synthesis	232
	Eukaryotic translation	233
	Prokaryotic translation	234
	Virus-induced changes in translation	236
	Questions for Chapter 13	236
	Problems for Part III	239
	Additional Reading for Part III	241

PART IV REPLICATION PATTERNS OF SPECIFIC VIRUSES 243

CHAPTER 14	Replication of Positive-sense RNA Viruses	245
	RNA viruses – general considerations	246
	A general picture of RNA-directed RNA replication	246
	Replication of positive-sense RNA viruses whose genomes are translated as the first step in gene expression	248
	Positive-sense RNA viruses encoding a single large open reading frame	249
	Picornavirus replication	249
	The poliovirus genetic map and expression of poliovirus proteins	249
	The poliovirus replication cycle	252
	Picornavirus cytopathology and disease	254
	Flavivirus replication	256
	Positive-sense RNA viruses encoding more than one translational reading frame	257

Two viral mRNAs are produced in different amounts during togavirus infections	258
The viral genome	258
The virus replication cycle	258
Togavirus cytopathology and disease	262
A somewhat more complex scenario of multiple translational reading frames and subgenomic mRNA expression: coronavirus replication	263
Coronavirus replication	264
Cytopathology and disease caused by coronaviruses	266
Replication of plant viruses with RNA genomes	267
Viruses with one genome segment	268
Viruses with two genome segments	268
Viruses with three genome segments	269
Replication of bacteriophage with RNA genomes	269
Regulated translation of bacteriophage mRNA	269
Questions for Chapter 14	272

CHAPTER 15 Replication Strategies of RNA Viruses Requiring RNA-directed mRNA Transcription as the First Step in Viral Gene Expression 273

Replication of negative-sense RNA viruses with a monopartite genome	275
Replication of vesicular stomatitis virus – a model for Mononegavirales	275
Vesicular stomatitis virus virion and genome	275
Generation, capping, and polyadenylation of mRNA	276
Generation of new negative-sense virion RNA	278
Mechanism of host shutoff by vesicular stomatitis virus	279
Cytopathology and diseases caused by rhabdoviruses	280
Paramyxoviruses	280
Pathogenesis of paramyxoviruses	280
Filoviruses and their pathogenesis	282
Bornaviruses	282
Influenza viruses – negative-sense RNA viruses with a multipartite genome	283
Involvement of the nucleus in flu virus replication	284
Generation of new flu nucleocapsids and maturation of the virus	285
Influenza A epidemics	285
Other negative-sense RNA viruses with multipartite genomes	288
Bunyaviruses	288
Virus structure and replication	288
Pathogenesis	291
Arenaviruses	291
Virus gene expression	292
Pathogenesis	292
Viruses with double-stranded RNA genomes	292

Reovirus structure	292
Reovirus replication cycle	294
Pathogenesis	295
Subviral pathogens	295
Hepatitis delta virus	296
Viroids	297
Prions	298
Questions for Chapter 15	301

CHAPTER 16 Replication Strategies of Small and Medium-Sized DNA Viruses 303

DNA viruses express genetic information and replicate their genomes in similar, yet distinct, ways	304
Papovavirus replication	305
Replication of SV40 virus – the model polyomavirus	305
The SV40 genome and genetic map	309
Productive infection by SV40	310
Abortive infection of cells nonpermissive for SV40 replication	312
Replication of papillomaviruses	314
The HPV-16 genome	316
Virus replication and cytopathology	316
Replication of adenoviruses	319
Physical properties of adenovirus	319
Capsid structure	319
The adenovirus genome	319
The adenovirus replication cycle	319
Early events	319
Adenovirus DNA replication	321
Late gene expression	321
VA transcription and cytopathology	321
Transformation of nonpermissive cells by adenovirus	323
Replication of some single-stranded DNA viruses	323
Replication of parvoviruses	323
Dependovirus DNA integrates in a specific site in the host cell genome	324
Parvoviruses have potentially exploitable therapeutic applications	325
DNA viruses infecting vascular plants	325
Geminiviruses	325
Single-stranded DNA bacteriophage Φ X174 packages its genes very compactly	326
Questions for Chapter 16	328

CHAPTER 17 Replication of Some Nuclear-Replicating Eukaryotic DNA Viruses with Large Genomes 331

Herpesvirus replication and latency	332
The herpesviruses as a group	332
Genetic complexity of herpesviruses	333

Common features of herpesvirus replication in the host	333
The replication of the prototypical alpha-herpesvirus – HSV	334
The HSV virion	334
The viral genome	334
HSV productive infection	338
HSV latency and LAT	347
HSV transcription during latency and reactivation	348
How do LAT and other specific HSV genes function – may be to accommodate reactivation?	350
EBV latent infection of lymphocytes, a different set of problems and answers	351
Pathology of herpesvirus infections	354
Herpesviruses as infectious co-carcinogens	354
Baculovirus, an insect virus with important practical uses in molecular biology	355
Virion structure	355
Viral gene expression and genome replication	356
Pathogenesis	356
Importance of baculoviruses in biotechnology	356
Questions for Chapter 17	357

CHAPTER 18 Replication of Cytoplasmic DNA Viruses and “Large” Bacteriophages 359

Poxviruses – DNA viruses that replicate in the cytoplasm of eukaryotic cells	360
The pox virion is complex and contains virus-coded transcription enzymes	360
The poxvirus replication cycle	361
Early gene expression	363
Genome replication	363
Intermediate and late stages of replication	363
Pathogenesis and history of poxvirus infections	364
Is smallpox virus a potential biological terror weapon?	364
Replication of “large” DNA-containing bacteriophages	365
Components of large DNA-containing phage virions	365
Replication of phage T7	367
The genome	367
Phage-controlled transcription	367
The practical value of T7	367
T4 bacteriophage: the basic model for all DNA viruses	367
The T4 genome	368
Regulated gene expression during T4 replication	369
Capsid maturation and release	370
Replication of phage λ : a “simple” model for latency and reactivation	370
The phage λ genome	372
Phage λ gene expression immediately after infection	372
Biochemistry of the decision between lytic and lysogenic infection in <i>E. coli</i>	375

A group of algal viruses shares features of its genome structure with poxviruses and bacteriophages	376
Questions for Chapter 18	377

CHAPTER 19	Retroviruses: Converting RNA to DNA	381
	Retrovirus families and their strategies of replication	382
	The molecular biology of retrovirus	383
	Retrovirus structural proteins	383
	The retrovirus genome	384
	Genetic maps of representative retroviruses	386
	Replication of retroviruses: an outline of the replication process	386
	Initiation of infection	386
	Capsid assembly and maturation	389
	Action of reverse transcriptase and RNase-H in synthesis of cDNA	389
	Virus gene expression, assembly, and maturation	391
	Transcription and translation of viral mRNA	391
	Capsid assembly and morphogenesis	391
	Mechanisms of retrovirus transformation	392
	Transformation through the action of a viral oncogene – a subverted cellular growth control gene	392
	Oncornavirus alteration of normal cellular transcriptional control of growth regulation	393
	Oncornavirus transformation by growth stimulation of neighboring cells	395
	Cellular genetic elements related to retroviruses	395
	Retrotransposons	396
	The relationship between transposable elements and viruses	397
	Questions for Chapter 19	397
 CHAPTER 20	 Human Immunodeficiency Virus Type 1 (HIV-1) and Related Lentiviruses	 399
	HIV-1 and related lentiviruses	399
	The origin of HIV-1 and AIDS	399
	HIV-1 and lentiviral replication	400
	Destruction of the immune system by HIV-1	406
	Questions for Chapter 20	411
 CHAPTER 21	 Hepadnaviruses: Variations on the Retrovirus Theme	 413
	The virion and the viral genome	413
	The viral replication cycle	415
	The pathogenesis of hepatitis B virus	415
	A plant “hepadnavirus”: cauliflower mosaic virus	416
	Genome structure	416
	Viral gene expression and genome replication	416
	The evolutionary origin of hepadnaviruses	417
	Questions for Chapter 21	419
	Problems for Part IV	421
	Additional Reading for Part IV	429

PART V VIRUSES: NEW APPROACHES AND NEW PROBLEMS 433

CHAPTER 22 The Molecular Genetics of Viruses 435

- Mutations in genes and resulting changes to proteins 437
- Analysis of mutations 438
 - Complementation 438
 - Recombination 439
- Isolation of mutants 440
 - Selection 440
 - HSV thymidine kinase – a portable selectable marker 440
 - Screening 441
- A tool kit for molecular virologists 441
- Viral genomes 441
- Locating sites of restriction endonuclease cleavage on the viral genome – restriction mapping 442
- Cloning vectors 443
 - Cloning of fragments of viral genomes using bacterial plasmids 444
 - Cloning using phage λ 449
 - Cloning single-stranded DNA with bacteriophage M13 451
 - DNA animal virus vectors 451
 - RNA virus expression systems 453
 - Defective virus particles 454
- Directed mutagenesis of viral genes 454
 - Site-directed mutagenesis 456
- Generation of recombinant viruses 456
 - Bacterial artificial chromosomes 458
- Questions for Chapter 22 461

CHAPTER 23 Molecular Pathogenesis 463

- An introduction to the study of viral pathogenesis 463
- Animal models 464
 - Choosing a model: natural host vs. surrogate models 464
 - Development of new models: transgenic animals 464
 - Hybrid models: the SCID-hu mouse 464
 - Considerations regarding the humane use of animals 465
- Methods for the study of pathogenesis 466
 - Assays of virulence 466
 - Analysis of viral spread within the host 467
 - Resolving the infection to the level of single cells 470
- Characterization of the host response 470
 - Immunological assays 470
 - Use of transgenic mice to dissect critical components of the host immune response that modulate the viral infection 471
- Question for Chapter 23 471

CHAPTER 24 Viral Bioinformatics and Beyond 473

- Bioinformatics 473
 - Bioinformatics and virology 473
- Biological databases 474

Primary databases	474
Secondary databases	475
Composite databases	475
Other databases	476
Biological applications	476
Similarity searching tools	476
Protein functional analysis	478
Sequence analysis	478
Structural modeling	478
Structural analysis	478
Systems biology and viruses	479
Viral internet resources	481
Questions for Chapter 24	484

CHAPTER 25	Viruses and the Future – Problems and Promises	485
	Clouds on the horizon – emerging disease	485
	Sources and causes of emergent virus disease	488
	The threat of bioterrorism	489
	What are the prospects of using medical technology to eliminate specific viral and other infectious diseases?	490
	Silver linings – viruses as therapeutic agents	490
	Viruses for gene delivery	491
	Using viruses to destroy other viruses	493
	Viruses and nanotechnology	493
	The place of viruses in the biosphere	494
	Why study virology?	494
	Questions for Chapter 25	495
	Problems for Part V	497
	Additional Reading for Part V	499

APPENDIX	Resource Center	501
	Books of historical and basic value	501
	Books on virology	501
	Molecular biology and biochemistry texts	503
	Detailed sources	503
	Sources for experimental protocols	503
	The Internet	504
	Virology sites	504
	Important websites for organizations and facilities of interest	505

Technical Glossary	507
Index	533
