Part I A Rigorous Approach to Advanced Calculus

1 Preliminaries	3
1 Real and complex numbers	3
2 Convergent and Cauchy sequences	10
3 Continuous functions	11
4 Derivatives and the Mean Value Theorem	13
5 Uniform convergence	18
6 Series. Series of functions	19
7 Power series	23
8 A few facts about the Riemann integral	26
9 Exercises	30
2 Metric and Topological Spaces I	33
1 Basics	33
2 Subspaces and products	37
3 Some topological concepts	39
4 First remarks on topology	43
5 Connected spaces	47
6 Compact metric spaces	51
7 Completeness	54
8 Uniform convergence of sequences of functions. Application: Tietze's Theorems	57
9 Exercises	62
3 Multivariable Differential Calculus	65
1 Real and vector functions of several variables	65
2 Partial derivatives. Defining the existence of a total differential	66
3 Composition of functions and the chain rule	71
4 Partial derivatives of higher order. Interchangeability	74
5 The Implicit Functions Theorem I: The case of a single equation	77
6 The Implicit Functions Theorem II: The case of several equations	81
7 An easy application: regular mappings and the Inverse Function Theorem	86

8	Taylor's Theorem, Local Extremes and Extremes with Constraints.....	87
9	Exercises	94
4	Integration I: Multivariable Riemann Integral and Basic Ideas Toward the Lebesgue Integral	97
1	Riemann integral on an n -dimensional interval	97
2	Continuous functions are Riemann integrable.....	100
3	Fubini's Theorem in the continuous case	101
4	Uniform convergence and Dini's Theorem	102
5	Preparing for an extension of the Riemann integral.....	105
6	A modest extension	107
7	A definition of the Lebesgue integral and an important lemma	109
8	Sets of measure zero; the concept of "almost everywhere"	113
9	Exercises	115
5	Integration II: Measurable Functions, Measure and the Techniques of Lebesgue Integration	117
1	Lebesgue's Theorems.....	117
2	The class Λ (measurable functions)	118
3	The Lebesgue measure	120
4	The integral over a set	123
5	Parameters.....	127
6	Fubini's Theorem	128
7	The Substitution Theorem	130
8	Hölder's inequality, Minkowski's inequality and L^p -spaces	135
9	Exercises	141
6	Systems of Ordinary Differential Equations	145
1	The problem.....	145
2	Converting a system of ODE's to a system of integral equations	147
3	The Lipschitz property and a solution of the integral equation	149
4	Existence and uniqueness of a solution of an ODE system	151
5	Stability of solutions	153
6	A few special differential equations	161
7	General substitution, symmetry and infinitesimal symmetry of a differential equation.....	165
8	Symmetry and separation of variables	168
9	Exercises	172
7	Systems of Linear Differential Equations.....	175
1	The definition and the existence theorem for a system of linear differential equations	175
2	Spaces of solutions	179
3	Variation of constants.....	181
4	A Linear differential equation of n th order with constant coefficients.....	183

5	Systems of LDE with constant coefficients. An application of Jordan's Theorem	187
6	Exercises	190
8	Line Integrals and Green's Theorem	193
1	Curves and line integrals	193
2	Line integrals of the first kind (= according to length)	197
3	Line integrals of the second kind	199
4	The complex line integral	202
5	Green's Theorem.....	204
6	Exercises	209

Part II Analysis and Geometry

9	Metric and Topological Spaces II	213
1	Separable and totally bounded metric spaces.....	213
2	More on compact spaces	216
3	Baire's Category Theorem	219
4	Completion.....	221
5	More on topological spaces: Separation	224
6	The space of continuous functions revisited: The Arzelà-Ascoli Theorem and the Stone-Weierstrass Theorem.....	229
7	Exercises	234
10	Complex Analysis I: Basic Concepts	237
1	The derivative of a complex function. Cauchy-Riemann conditions	237
2	From the complex line integral to primitive functions	243
3	Cauchy's formula	245
4	Taylor's formula, power series, and a uniqueness theorem	248
5	Applications: Liouville's Theorem, the Fundamental Theorem of Algebra and a remark on conformal maps	252
6	Laurent series, isolated singularities and the Residue Theorem	254
7	Exercises	263
11	Multilinear Algebra	267
1	Hom and dual vector spaces	267
2	Multilinear maps and the tensor product	271
3	The exterior (Grassmann) algebra	276
4	Exercises	284
12	Smooth Manifolds, Differential Forms and Stokes' Theorem	287
1	Smooth manifolds	287
2	Tangent vectors, vector fields and differential forms.....	292
3	The exterior derivative and integration of differential forms	298
4	Integration of differential forms and Stokes' Theorem	301
5	Exercises	307

13	Complex Analysis II: Further Topics	311
1	The Riemann Mapping Theorem	312
2	Holomorphic isomorphisms of disks onto polygons and the Schwartz-Christoffel formula	317
3	Riemann surfaces, coverings and complex differential forms	321
4	The universal covering and multi-valued functions	332
5	Complex analysis beyond holomorphic functions	340
6	Exercises	346
14	Calculus of Variations and the Geodesic Equation	349
1	The basic problem of the calculus of variations, and the Euler-Lagrange equations	349
2	A few special cases and examples	352
3	The geodesic equation	356
4	The geometry of geodesics	360
5	Exercises	365
15	Tensor Calculus and Riemannian Geometry	367
1	Tensor calculus	368
2	Affine connections	371
3	Tensors associated with an affine connection: torsion and curvature	374
4	Riemann manifolds	378
5	Riemann surfaces and surfaces with Riemann metric	381
6	Exercises	390
16	Banach and Hilbert Spaces: Elements of Functional Analysis	393
1	Banach and Hilbert spaces	393
2	Uniformly convex Banach spaces	395
3	Orthogonal complements and continuous linear forms	397
4	Infinite sums in a Hilbert space and Hilbert bases	402
5	The Hahn-Banach Theorem	408
6	Dual Banach spaces and reflexivity	411
7	The duality of L^p -spaces	415
8	Images of Banach spaces under bounded linear maps	419
9	Exercises	424
17	A Few Applications of Hilbert Spaces	427
1	Some preliminaries: Integration by a measure	427
2	The spaces $L^p_\mu(X, \mathbb{C})$ and the Radon-Nikodym Theorem	432
3	Application: The Fundamental Theorem of (Lebesgue) Calculus	435
4	Fourier series and the discrete Fourier transformation	440
5	The continuous Fourier transformation	443
6	Exercises	448

A Linear Algebra I: Vector Spaces 451

 1 Vector spaces and subspaces 451

 2 Linear combinations, linear independence 454

 3 Basis and dimension 457

 4 Inner products and orthogonality 460

 5 Linear mappings 464

 6 Congruences and quotients 468

 7 Matrices and linear mappings 469

 8 Exercises 474

B Linear Algebra II: More about Matrices 477

 1 Transforming a matrix. Rank 477

 2 Systems of linear equations 479

 3 Determinants 485

 4 More about determinants 489

 5 The Jordan canonical form of a matrix 493

 6 Exercises 498
