

DETAILED CONTENTS

Preface	ix	Next generation sequencing platforms	95
Acknowledgements	x	Methodological advancements in next generation sequencing	100
1 Molecular ecology: roots and branches	1	Next generation sequencing applications in molecular ecology	102
What is <i>molecular ecology</i> ?	1	Deep sequencing	104
Overview and organization of this book	4	Targeted sequencing	106
Evolutionary framework for molecular ecology	5	Marker discovery and genotyping	108
Molecules, molecular markers, and molecular ecology	13	Transcriptomics	111
Next generation molecular ecology	17	Epigenomics	115
Putting the ecology back into molecular ecology	22	Next generation sequencing: a panacea for molecular ecology?	119
Summary	24	Summary	122
2 Molecular biology for ecologists	26	5 Species, populations, and individuals	123
Introduction	26	Introduction	123
Nucleic acids and the common origin of life	27	The species problem	124
Structure of DNA and RNA	28	Hybrids and hybrid zones	130
Mutation as the source for all genetic variation	32	Evolutionary significant units and management units	134
Accessing DNA sequence information	35	Cryptic species, sibling species, and sister species	136
DNA to proteins	43	DNA barcoding, metabarcoding, and metagenomics	139
Proteins	47	Environmental DNA	144
Genome organization and genomics	49	Ancient DNA and proteins	147
Eukaryotic genome structure	51	Dealing with individuals	153
Non-coding DNA	52	Identification of sex	157
Coding and other functional genomic regions	55	Bits of individuals: non-invasive sampling	160
Gene expression, the transcriptome, and proteome	59	Summary	163
Summary	62	6 Behavioural ecology	165
3 Molecular tools for molecular ecologists	64	Introduction	165
Introduction	64	From monogamy to promiscuity	166
Genetic manipulation in molecular ecology	66	Sexual dimorphism and male dominance	175
Protein and DNA extraction from tissue samples	68	Female reproductive behaviour	178
Non-PCR-based tools for studying genetic variation	71	Sex ratio biases in offspring	183
Accessing the genome using PCR-based molecular markers	76	Cooperative behaviour	184
PCR-based molecular markers requiring sequence information from the study species	77	Cheating tactics	187
PCR-based molecular markers NOT requiring sequence information from the study species	83	Foraging and dispersal	189
Measuring gene expression	87	Behaviourally mediated speciation	192
Next generation sequencing and the marker revolution	89	Genomes, genomics, and animal behaviour	198
Summary	89	Epigenetics and behavioural ecology	200
4 Next generation sequencing	91	Current direction and future challenges for behavioural ecology	203
Introduction	91	Summary	204
First, second, and third generation sequencing	92		

7	Population genetics	206	11	Microbial ecology and metagenomics	355
	Introduction	206		Microbial diversity and metagenomes	355
	Genetic diversity in natural populations	207		Outstanding issues in microbial ecology	358
	Effective population size	214		Immunological approaches to microbial ecology	362
	Population bottlenecks and expansions	218		Ribosomal sequences and microbial ecology: start of metagenomics	366
	Population structure	221		Genomic approaches to microbial ecology	378
	Genetics of metapopulations	227		Bacteria and the concept of species	382
	Gene flow and migration rates	231		Viral diversity	386
	Identification of immigrants	236		Phylogeography	387
	Landscape genetics: bringing it all together	238		Overview of microbial molecular ecology	389
	Molecular markers for population genetics: an appraisal	240		Summary	390
	Summary	242	12	Genomes	392
8	Neutral and adaptive molecular variation	243		Introduction	392
	Introduction	243		First genome sequences	397
	Genetic variation in populations	245		Human Genome Project and competing sequencing strategies for eukaryotic genomes	399
	Genetic load, natural selection, and the neutral theory	247		Depth and breadth of genome sequencing	403
	Neutral and adaptive variation	251		Genome reassembly and analysis	405
	Neutral markers which are not completely neutral	256		Genome annotation	413
	Heterozygosity and fitness	260		Whole genomes or complete genomes?	414
	Molecular approaches to understanding adaptive variation	265		Diploid genome sequences	415
	Genomics and the study of adaptive variation	273		Genome sequences of non-model organisms	416
	Summary	277		Microbiomes	429
				Summary	432
9	Phylogeography	278	13	Genomics	434
	Introduction	278		Introduction	434
	Molecular markers in phylogeography	279		Comparative genomics	435
	Genetic variation in space	287		Genome architecture and gene expression	438
	Genetic variation in time	304		Evolutionary genomics	442
	Phylogeography of microorganisms	309		Phylogenomics	443
	Applied phylogeography	311		Genetic variability	446
	Summary	320		Population genomics	448
				Conservation genomics	449
10	Conservation genetics	322		Adaptation	451
	Introduction	322		Speciation	452
	Molecular genetics in conservation biology	324		Transcriptomics	456
	Genetic diversity as a conservation issue	326		Proteomics	457
	Inbreeding and genetic load	330		Metabolomics	461
	Genetic restoration	336		Epigenomics	462
	Captive breeding for reintroduction into the wild	338		Genome editing	463
	Desperate measures	339		Molecular ecology comes of age	469
	Wildlife health and disease	344		Summary	470
	Wildlife forensics	347			
	Genetics in conservation biology—a wider role	348		References	472
	Summary	354		Index	519
