| Preface  | xi     |
| Acknowledgments  | xiii   |
| <br>PART 1. GROUPS AND SPACES                            | <br>1  |
| 1. Groups <i>Matt Clay and Dan Margalit</i>              | 3      |
| 1.1 Groups   | 5      |
| 1.2 Infinite groups                                      | 9      |
| 1.3 Homomorphisms and normal subgroups                   | 13     |
| 1.4 Group presentations                                  | 17     |
| 2. ...and Spaces <i>Matt Clay and Dan Margalit</i>       | 21     |
| 2.1 Graphs   | 23     |
| 2.2 Metric spaces  | 34     |
| 2.3 Geometric group theory: groups and their spaces      | 40     |
| <br>PART 2. FREE GROUPS                                  | <br>43 |
| 3. Groups Acting on Trees <i>Dan Margalit</i>            | 45     |
| 3.1 The Farey tree                                       | 46     |
| 3.2 Free actions on trees                                | 50     |
| 3.3 Non-free actions on trees                            | 56     |
| 4. Free Groups and Folding <i>Matt Clay</i>              | 66     |
| 4.1 Topological model for the free group                 | 67     |
| 4.2 Subgroups via graphs                                 | 70     |
| 4.3 Applications of folding                              | 73     |
| 5. The Ping-Pong Lemma <i>Johanna Mangahas</i>           | 85     |
| 5.1 Statement, proof, and first examples using ping-pong | 85     |
| 5.2 Ping-pong with Möbius transformations                | 90     |
| 5.3 Hyperbolic geometry                                  | 95     |
| 5.4 Final remarks  | 103    |

|   |                                     |         |
|---|-------------------------------------|---------|
| 6. Automorphisms of Free Groups                         | <i>Matt Clay</i>                    | 106     |
| 6.1 Automorphisms of groups: first examples             |                                     | 106     |
| 6.2 Automorphisms of free groups: a first look          |                                     | 108     |
| 6.3 Train tracks  |                                     | 110     |
| <br>PART 3. LARGE SCALE GEOMETRY                        |                                     | <br>123 |
| 7. Quasi-isometries                                     | <i>Dan Margalit and Anne Thomas</i> | 125     |
| 7.1 Example: the integers                               |                                     | 126     |
| 7.2 Bi-Lipschitz equivalence of word metrics            |                                     | 127     |
| 7.3 Quasi-isometric equivalence of Cayley graphs        |                                     | 130     |
| 7.4 Quasi-isometries between groups and spaces          |                                     | 133     |
| 7.5 Quasi-isometric rigidity                            |                                     | 139     |
| <br>8. Dehn Functions                                   | <i>Timothy Riley</i>                | <br>146 |
| 8.1 Jigsaw puzzles reimaged                             |                                     | 147     |
| 8.2 A complexity measure for the word problem           |                                     | 149     |
| 8.3 Isoperimetry  |                                     | 156     |
| 8.4 A large-scale geometric invariant                   |                                     | 162     |
| 8.5 The Dehn function landscape                         |                                     | 163     |
| <br>9. Hyperbolic Groups                                | <i>Moon Duchin</i>                  | <br>176 |
| 9.1 Definition of hyperbolicity                         |                                     | 178     |
| 9.2 Examples and nonexamples                            |                                     | 182     |
| 9.3 Surface groups                                      |                                     | 186     |
| 9.4 Geometric properties                                |                                     | 193     |
| 9.5 Hyperbolic groups have solvable word problem        |                                     | 197     |
| <br>10. Ends of Groups                                  | <i>Nic Koban and John Meier</i>     | <br>203 |
| 10.1 An example   |                                     | 203     |
| 10.2 The number of ends of a group                      |                                     | 206     |
| 10.3 Semidirect products                                |                                     | 208     |
| 10.4 Calculating the number of ends of the braid groups |                                     | 213     |
| 10.5 Moving beyond counting                             |                                     | 215     |
| <br>11. Asymptotic Dimension                            | <i>Greg Bell</i>                    | <br>219 |
| 11.1 Dimension  |                                     | 219     |
| 11.2 Motivating examples                                |                                     | 220     |
| 11.3 Large-scale geometry                               |                                     | 223     |
| 11.4 Topology and dimension                             |                                     | 225     |
| 11.5 Large-scale dimension                              |                                     | 227     |
| 11.6 Motivating examples revisited                      |                                     | 231     |
| 11.7 Three questions                                    |                                     | 233     |
| 11.8 Other examples                                     |                                     | 234     |

|  |  |         |
|--|--|---------|
| 12. Growth of Groups                                     | <i>Eric Freden</i>                                       | 237     |
| 12.1 Growth series                                       |  | 238     |
| 12.2 Cone types  |  | 244     |
| 12.3 Formal languages and context-free grammars          |  | 250     |
| 12.4 The DSV method                                      |  | 256     |
| <br>PART 4. EXAMPLES                                     |  | <br>267 |
| 13. Coxeter Groups                                       | <i>Adam Piggott</i>                                      | 269     |
| 13.1 Groups generated by reflections                     |  | 269     |
| 13.2 Discrete groups generated by reflections            |  | 275     |
| 13.3 Relations in finite groups generated by reflections |  | 278     |
| 13.4 Coxeter groups                                      |  | 281     |
| 14. Right-Angled Artin Groups                            | <i>Robert W. Bell and Matt Clay</i>                      | 291     |
| 14.1 Right-angled Artin groups as subgroups              |  | 293     |
| 14.2 Connections with other classes of groups            |  | 295     |
| 14.3 Subgroups of right-angled Artin groups              |  | 298     |
| 14.4 The word problem for right-angled Artin groups      |  | 301     |
| 15. Lamplighter Groups                                   | <i>Jennifer Taback</i>                                   | 310     |
| 15.1 Generators and relators                             |  | 311     |
| 15.2 Computing word length                               |  | 315     |
| 15.3 Dead end elements                                   |  | 318     |
| 15.4 Geometry of the Cayley graph                        |  | 321     |
| 15.5 Generalizations                                     |  | 327     |
| 16. Thompson's Group                                     | <i>Sean Cleary</i>                                       | 331     |
| 16.1 Analytic definition and basic properties            |  | 332     |
| 16.2 Combinatorial definition                            |  | 336     |
| 16.3 Presentations                                       |  | 340     |
| 16.4 Algebraic structure                                 |  | 345     |
| 16.5 Geometric properties                                |  | 352     |
| 17. Mapping Class Groups                                 | <i>Tara Brendle, Leah Childers, and<br/>Dan Margalit</i> | 358     |
| 17.1 A brief user's guide to surfaces                    |  | 359     |
| 17.2 Homeomorphisms of surfaces                          |  | 363     |
| 17.3 Mapping class groups                                |  | 367     |
| 17.4 Dehn twists in the mapping class group              |  | 370     |
| 17.5 Generating the mapping class group by Dehn twists   |  | 373     |
| 18. Braids   | <i>Aaron Abrams</i>                                      | 384     |
| 18.1 Getting started                                     |  | 384     |
| 18.2 Some group theory                                   |  | 387     |

|              |                                     |     |
|--------------|-------------------------------------|-----|
| 18.3         | Some topology: configuration spaces | 395 |
| 18.4         | More topology: punctured disks      | 400 |
| 18.5         | Connection: knot theory             | 404 |
| 18.6         | Connection: robotics                | 407 |
| 18.7         | Connection: hyperplane arrangements | 409 |
| 18.8         | A stylish and practical finale      | 411 |
| Bibliography |                                     | 419 |
| Index        |                                     | 437 |
